Tagging

Tuesday, November 25, 2025 10:43 PM

Tagging commits is used to **mark release points such as V1.0.0**, V1.0.1 and so on. In this section, you'll learn how to list existing tags, how to create and delete tags, and what the different types of tags are

Creating Tags

Two types of tags

1. Lightweight
    a. it's just a pointer to a specific commit
    b. Use this type of tag if you want a **temporary** tag or for some reason **don't want to keep** the other **information**

2. Annotated
    a. Annotated tags, however, are **stored** as full objects in the **Git database**.
    b. They're **checksummed**; contain the **tagger name**, **email**, and **date**; have a **tagging message**
    c. It's generally recommended that you create annotated tags so you can have all this information

    #Create Annotated Tags:

    git tag -a <tagname> -m <tag commit message>

    #Create Lightweight Tags:

    git tag <tagname>

    #Show Tags:

    git show <tagname>

Tagging Later

You can also **tag commits** after you've moved past them. Suppose your commit history looks like this

```
commit a4174a06d9a456bb8621ab843f676958d18bb18d (HEAD -> master)
Author: sajidali <sajid.ali@giki.edu.pk>
Date:   Thu Sep 29 09:10:04 2022 +0500

    some changes in gitignore file

commit 08aeb80cfd061313fdddb45d535cd0a1c96a3f18
Author: sajidali <sajid.ali@giki.edu.pk>
Date:   Thu Sep 29 09:00:26 2022 +0500

    initial commit
```

<u>#Tag Committ -- 08aeb80cfd061313fdddb45d535cd0a1c96a3f18:</u>

git tag -a v1.0.1 08aeb80cfd061313fdddb45d535cd0a1c96a3f18 -m 'my first tag'

Sharing Tags

By default, the ***git push*** command **doesn't transfer tags** to remote servers. You will have to **explicitly push tags** to a shared server after you have created them.

This process is just like sharing remote branches — you can run

git push origin <tagname>

Transfer all of your tags to the remote server

git push <remote> --tags

Only transfer annotated tags to the remote server

git push <remote> --follow-tags

Deleting Tags

Delete tags locally

git tag -d <tagname>

Delete tags on server

git push origin : /refs/tags/<tagname>

Other way to delete tag from remote server

git push <remote> --delete <tagname>

Checkingout Tags

Switch between tags

git checkout <tagname>

Delete tags on server

git push origin : /refs/tags/<tagname>

Other way to delete tag from remote server

git push <remote> --delete <tagname>
